

# The Entity-Relationship Model

Olaf Hartig

David R. Cheriton School of Computer Science  
University of Waterloo

CS 640  
Principles of Database Management and Use  
Winter 2013

These slides are based on a slide set  
provided by Prof. M. Tamer Özsu.

---

## Outline

- 1 Basic Elements
  - Entities
  - Attributes
  - Relationships
  - Roles
- 2 Additional Features
  - Keys
  - Cardinality Constraints
  - Weak Entities
- 3 Common Extensions
  - Specialization
  - Generalization
- 4 Design Considerations

Notes

---

---

---

---

---

---

---

---

## Overview of the E-R Model

- Proposed by Peter Chen in 1976
- Used for designing the conceptual schema for a database
  
- Relevant parts of the world/enterprise described in terms of:
  - entities,
  - attributes, and
  - relationships.
  
- Graphical presentation: E-R diagram
- Many variant notations and extensions are in common use
  - e.g. Teorey et al.'s EER model (as discussed next week)

Notes

---

---

---

---

---

---

---

---

## Entities and Entity Sets

**Entity:** a *distinguishable* object

**Entity set:** set of entities of same type

Examples:

- students currently at University of Waterloo
- flights offered by Air Canada
- burglaries in Ontario during 1994

Graphical representation of entity sets:

Notes

---

---

---

---

---

---

---

---

## Attributes

**Attributes:** describe properties of entities

All entities in an entity set have the same set of attributes.

**Domain:** set of permitted values for an attribute

### Note

What is an attribute in one application, can be an entity in another.

Notes

---

---

---

---

---

---

---

---

## Types of Attributes

**Basic attributes:** have an atomic value (e.g. an integer, a color name)

**Composite attributes:** composed of other attributes (e.g. an address)

**Multivalued attributes:** attributes that are set-valued (e.g. hobbies)

Notes

---

---

---

---

---

---

---

---

## Relationships and Relationship Sets

**Relationship:** representation of the fact that certain entities are related to each other

Example:

- student Bob is registered in course CS 640

**Relationship set:** set of relationships of a given type

Examples:

- students registered in courses
- passengers booked on flights
- parents and their children
- bank branches, customers and their accounts

**Degree:** number of participating entities / entity sets

Notes

---

---

---

---

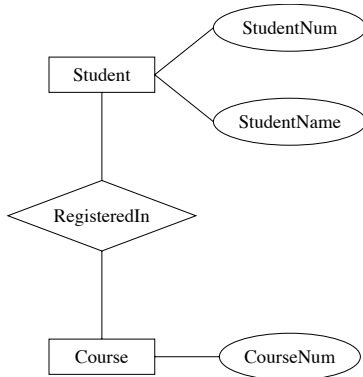

---

---

---

---

## Relationships and Relationship Sets (cont'd)

Notes

---

---

---

---

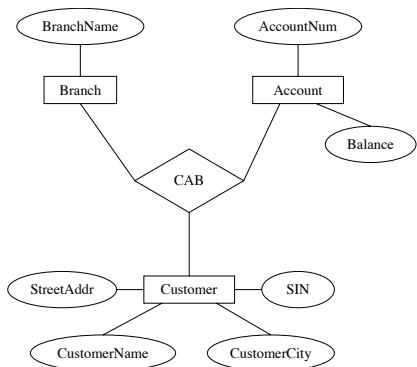

---

---

---

---

## Relationships and Relationship Sets (cont'd)

Notes

---

---

---

---

---

---

---

---

## Roles

**Role:** the function of an entity set in a relationship set

**Role name:** an explicit indication of a role

### Attention

Role labels are needed whenever an entity set has multiple functions in a relationship set.

Notes

---

---

---

---

---

---

---

---

## Relationships and Attributes

### Note

Relationships may also have attributes.

Notes

---

---

---

---

---

---

---

---

## Additional Features

- Keys
- Cardinality constraints
- Weak entities

Notes

---

---

---

---

---

---

---

---

## Keys

Entities in an entity set must be distinguishable from one another.

**Key:** set of attributes such that each entity has a unique combination of values for these attributes (among all other entities in the set)

Example 1:

Example 2:

Notes

---

---

---

---

---

---

---

---

## Types of (Binary) Relationship Sets

**many-to-many (N:N):** an entity in one set can be related to many entities in the other set, and vice versa  
(This is the interpretation we have used so far.)

**many-to-one (N:1):** each entity in one set can be related to at most one entity in the other, but an entity in the second set may be related to many entities in the first

**one-to-many (1:N):** vice versa

**one-to-one (1:1):** each entity in one set can be related to at most one entity in the other, and vice versa

Notes

---

---

---

---

---

---

---

---

## Weak Entities

Sometimes the existence of an entity depends on the existence of another entity

**Weak Entity:** can be identified uniquely only by considering another entity (called *owner entity*)

Notes

---

---

---

---

---

---

---

---

## Weak Entities (cont'd)

Attributes of a weak entity only form key relative to the owner entity.

**Discriminator:** set of attributes that distinguish weak entities associated with a *particular* owner entity

**Key:** discriminator + key of the owner entity set

Notes

---

---

---

---

---

---

---

---

## Weak Entities (cont'd)

- A weak entity set must have a many-to-one (identifying) relationship to a distinct entity set (the *owner entity set*).
- Visually distinguishing an identifying relationship set:

Notes

---

---

---

---

---

---

---

---

## Extensions to the E-R Models

- Specialization / Generalization
- Participation constraints
  - see Teorey et al.
- etc.

Notes

---

---

---

---

---

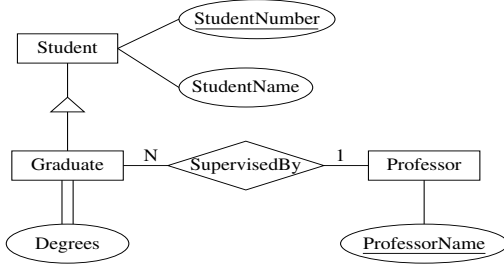

---

---

---

## Specialization

A specialized kind of entity set may be derived from a given entity set

Key is always only given for the general entity set

Notes

---

---

---

---

---

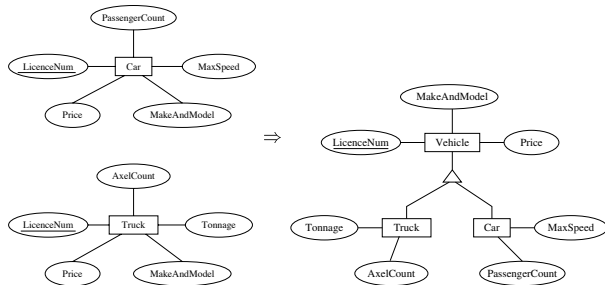

---

---

---

## Generalization

Several entity sets can be abstracted by a more general entity set

Notes

---

---

---

---

---

---

---

---

## Constraints for Specializations

**disjoint** entities of the general set belong to *at most* one special set

- e.g. every vehicle is either a truck or a car (not both)

*vs.*

**overlapping** entities of the general set *may* belong to more than one special set

- e.g. some vehicles may be truck and car (to accommodate utility vehicles, perhaps)

**complete** entities of the general set must belong to a special set

- e.g. every vehicle is also a truck or a car (or both)

*vs.*

**incomplete** entities of the general set need not belong to a special set

- e.g. some vehicles may neither be a truck nor a car

Notes

---

---

---

---

---

---

---

---

## Constraints for Specializations (cont'd)

A possible graphical representation:
